## Study guide for Math 244 Midterm 1

## Monday, September 24

These are the sorts of questions you should know how to solve for the first midterm.

- 1. Know how to state all the versions of Fubini's theorem we have used. Pay special note to the assumptions needed about the function f(x, y)!
- 2. Consider the planes given by x + y 2z = 4 and 2x + 3z = 1. Find an equation for the line which is their intersection.
- 3. Consider the three points (1, 2, 3), (-1, 2, -3) and (1, -1, -1). Find an equation for the plane spanned by them.
- 4. Calculate the double integral  $\iint_R e^x \sin y + e^y \cos x \, dA$  over the rectangular region R given by  $0 \le x \le \pi$  and  $0 \le y \le \pi/2$ .
- 5. What is the volume between the paraboloid  $z = x^2 + y^2$  and the plane z = 9?
- 6. Calculate the double integral  $\iint_R y e^{x+y} dA$  over the triangular region R bounded by the lines y = 2x, x = 0, and y = 2.
- 7. What is the average value of the function  $f(x, y) = 2x^2 + 2y^2 \sqrt{x^2 + y^2}$  over the circular region of radius 3 centered at the origin?
- 8. Set up but do not solve four different iterated integrals which are equal to the double integral

$$\iint_R xy + e^{x^2 + y^2} \, \mathrm{d}A$$

where R is the upper half circle of radius  $\pi$  centered at the origin. (Hint: you can get two in rectangular coordinates, and two in polar coordinates.)

9. Sketch the region R bounded by the curves  $y = x^2$  and  $x = y^2$ . What is the average value of the function f(x, y) = x + y over this region R?
