## Math 302: Separable differential equations

#### Kameryn J Williams

University of Hawai'i at Mānoa

Spring 2021

When dealing with differential equations, it is often helpful to split up  $\frac{dy}{dx}$  into dy and dx.

(日) (同) (三) (三)

When dealing with differential equations, it is often helpful to split up  $\frac{dy}{dx}$  into dy and dx.

• We call dv the differential for the variable v. It is a new variable representing an infinitesimal change in v.

# An example

$$\frac{\mathrm{d}y}{\mathrm{d}x}(yx^2-2x^2)=y^3$$

# Separable differential equations

A first-order ODE in the variables x and y is separable if it can be written in the form

$$P(y) \, \mathrm{d} y = Q(x) \, \mathrm{d} x.$$

## Separable differential equations

A first-order ODE in the variables x and y is separable if it can be written in the form

$$P(y) dy = Q(x) dx.$$

If an ODE is separable, it has a family of solutions given by the implicit equation

$$\int P(y)\,\mathrm{d} y = \int Q(x)\,\mathrm{d} x + C,$$

where C is an arbitrary constant.

#### Why does this work????

K Williams (U. Hawai'i @ Mānoa) Math 302: Separable differential equations 990

(ロ) (四) (三) (三)

# Why does this work????

This is an application of the chain rule.

イロト イヨト イヨト イヨト

### Another example

Let's find a 1-parameter family of solutions for

$$\frac{\mathrm{d}r}{\mathrm{d}\theta} = r \tan \theta$$
